

REPAIR DESK

FILE 001

MY RESEARCH IS IN THIS LIBRARY.

A small tool for keeping its records
trustworthy.

Public source. Synthetic faults.
Inspectable decisions.

Every resolved ticket should leave behind a regression test.

01 PRESERVE / 02 REPLAY / 03 DECIDE / 04 EXPLAIN

CASE	THE EVIDENCE QUESTION	DISPOSITION
01	Dropped affiliation Compare the injected transform loss with preserved source evidence.	REPAIR
02	Conflicting ORCIDs Conflicting identifiers require review before any reassignment.	ESCALATE
03	Sparse metadata Missing source evidence is a limit, not an invitation to invent it.	LEAVE ALONE
04	Repeated delivery Repeat deliveries of the same work ID should not create duplicates.	DEDUPLICATE

SOURCE / W4410234973

The seed is a paper I co-authored on IoT-enabled smart waste management. Its live record is not alleged to be broken: every demonstrated fault is injected locally.

BOUNDARY / LOCAL PROTOTYPE

Python + SQLite. Immutable inputs and repeatable checks. No production-scale claim, no trained model, no writes to OpenAlex. Built with AI assistance.

RUN THE REPLAY

```
python3 -m repairedesk serve --port 8765
```
